

The Decision Log

- **Architecture Deep Dive:** Analyzed the fundamental structural variance between compiled languages (like Java) and interpreted scripting languages (like Python), establishing why Python execution happens line-by-line in real-time.
- **Memory Optimization:** Replaced loose global file manipulation commands with a structured context manager block, safely sealing the resource stream upon content delivery.
- **Error Resilience Implementation:** Anticipated file absence failures by implementing targeted `FileNotFoundError` catch nets, upgrading the script from a volatile tool into a production-grade component.
- **Modularization:** Abstracted raw file manipulation lines into a highly isolated, reusable function (`load_resume_text`) accepting dynamic string paths.
- **Orchestrator Validation:** Successfully verified standard package sharing and scope isolation by importing a custom script module into a separate driver application.
